

INSPECTION UNIT GAINS OPTIONAL AIR DIVERTER

CAPWATCHER III Intravis has updated its CapWatcher III vision inspection system with the addition of an optional air diverter for closure transportation. The inspection system is equipped with an assortment of high-resolution color cameras to inspect as many as 252,000 caps every hour.

WHAT'S NEW? The air diverter, which offers a new way of moving caps. Shown in yellow in the image below, the air diverter system, including air compressor, tubing and octabin diverter, distributes caps into bins after they have been approved by CapWatcher III. It provides gentle transportation of inspected caps to the production outfeed.

BENEFITS Flexibility, especially in areas where space is limited. The diverter can reduce the length of a production line by about 1 foot, 7 inches. With the air diverter, closures can be conveyed above the machines over long distances.
